                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  DOWAIN: The N-terminal region may be exposed to the interior of the granule, whereas the C-terminal portion may be embedded in the membrane. During phagocytosis and degranulation, proteases may be released and activated and cleave BPI at the junction of the N- and C-terminal portions of the molecule, providing controlled release of the N-terminal antibacterial fragment when bacteria are ingested (By similarity).
                                                                                                                                                                                                                                                                                                                                Leukocytes (PMN) granules (By similarity).

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     similarity).

DOMAIN: The N-terminal region may be exposed to the interior of bownin; whereas the C-terminal portion may be embedded in the membrane. During phagocytosis and degranulation, proteases may be released and activated and cleave BPI at the junction of the N-and C-terminal portions of the molecule, providing controlled release of the N-terminal antibacterial fragment when bacteria are ingested (By similarity).
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     1 QKGLDYACQQGVAVLQKELEKIRIPDVSGKFKLRPFGKGHYNFHSLVVRSFQLDNPQIRL

Weiss J., Weinrauch Y., Levy O., Flynn S.;
Submitted (JUN-1996) to the EMBL/GenBank/DDBJ databases.
-!- FUNCTION: The cytotoxic action of BPI is limited to many species of Gram-negative bacteria; this specificity may be explained by a strong affinity of the very basic N-terminal half for the negatively charged lipopolysaccharides that are unique to the Gram-negative bacterial outer envelope (By similarity).
-!- SUBCELLULAR LOCATION: Membrane-associated in polymorphonuclear Leukocytes (PMN) granules (By similarity).
-!- TISSUE SPECIFICITY: Restricted to cells of the myeloid series (By

Natl. Acad. Sci. U.S.A. 99:16899-16903 (2002).

-!- FUNCTION: Binds to the lipid a moiety of bacterial lipopolysaccharides (LPS), a glycolipid present in the outer membrane of all Gram-negative bacteria. The LBP/LPS complex seems to interact with the CD14 receptor.
-!- SUBCELLULAR LOCATION: Secreted.
-!- SIMILARITY: Belongs to the BPI/LBP/Plunc superfamily. BPI/LBP
                                                                                                                                                                                                                                                                                               MEDLINE=97289150; PubMed=9144073;

The LBP/LPS complex seems to interact with the CD14 receptor.

-i- SUBCELULAR LOCATION: Secreted.

-i- SIMILARITY: Belongs to the BPI/LBP/Plunc superfamily. BPI/LBP

"Molecular cloning, characterization, and tissue distribution of rat lipopolysaccharide binding protein. Evidence for extrahepatic expression.";

J. Immunol. 153,743752 (1994).

I. J. Immunol. 153,743752 (1994).

I. FUNCTION: Binds to the lipid a moiety of bacterial ipopolysaccharides (LPS), a glycolipid present in the outer membrane of all Gram-negative bacteria. The LBP/LPS complex seems to interact with the CD14 receptor.

C. I. SUBMILARITY: Belongs to the BPI/LBP/Plunc superfamily. BPI/LBP

J. Exp. Med. 164:777-793 (1986).
-!- FUNCTION: Binds to the lipid a moiety of bacterial
-!- FUNCTION: Binds to the lipid a moiety of bacterial
lipopolysaccharides (LSS), a glycolipid present in the outer
membrane of all Gram-negative bacteria. The LBP/LPS complex seems
to interact with the CD14 receptor.
-!- SUBCELLULAR LOCATION: Secreted.
-!- SUBCELLULAR LOCATION: Secreted.
-!- SIMILARITY: Belongs to the BPI/LBP/Plunc superfamily. BPI/LBP
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         PROSITE; PS00400; LBP BPI CETP; 1.

Control of the cycloxic action of BPI is limited to many species of Gram-negative bacteria; this specificity may be explained by a strong affinity of the very basic N-terminal half for the negatively charged lipopolysaccharides that are unique to the negatively charged lipopolysaccharides that are unique to the cram-negative bacterial outer envelope.

C. --- SUBCELLULAR LOCATION: Membrane-associated in polymorphonuclear leukcoytes (PMN) granules.

C. --- DOMAIN: The N-terminal region may be exposed to the interior of the granule, whereas the C-terminal portion may be embedded in the membrane. During phagocytosis and degranulation, proteases may be released and activated and cleave BPI at the junction of the N-cleaninal portions of the molecule, providing controlled are release of the N-terminal antibacterial fragment when bacteria are

DOMAIN: The N-terminal region may be exposed to the interior of the granula, whereas the C-terminal portion may be embedded in the membrane. During phagocytosis and degranulation, proteases may be released and activated and cleave BPI at the junction of the N-and C-terminal portions of the molecule, providing controlled release of the N-terminal antibacterial fragment when bacteria are
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     increasing protein (BPI).";
Nucleic Acids Res. 18:3052-3052(1990).
-!- FUNCTION: The cytocoxic action of BPI is limited to many species of Gram-negative bacteria; this specificity may be explained by a serving affinity of the very basic N-terminal half for the negatively charged lipopolysaccharides that are unique to the Gram-negative bacterial outer envelope.
-!- SUBCELLULAR LOCATION: Membrane-associated in polymorphonuclear Leukocytes (PMM) granules (By similarity).
-!- TISSUE SPECIFICITY: Restricted to cells of the myeloid series (By

Downlar region may be exposed to the interior of DOWAIN: The N-terminal region may be embedded in the membrane. During phagocytosis and degranulation, proteases may be released and activated and cleave BT at the junction of the N-and C-terminal portions of the molecule, providing controlled and cleave BT.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            STRAIN=New Zealand white; TISSUE=Bone marrow;
Weiss J., Weinrauch Y., Levy O., Flynn S.;
Submitted (JUN-1996) to the EMBL/GenBank/DDBJ databases.

-!- FUNCTION: The cytocoxic action of BPI is limited to many species
of Gram-negative bacteria; this specificity may be explained by a strong affinity of the very basic N-terminal half for the negatively charged lipopolysaccharides that are unique to the Gram-negative bacterial outer envelope (By similarity).
-!- SUBCELLULAR LOCATION: Membrane-associated in polymorphonuclear Leukocytes (PMN) granules (By similarity).
-!- TISSUE SPECIFICITY: Restricted to cells of the myeloid series (By

-!- FUNCTION: Bainds to the lipid a moiety of bacterial
-!- FUNCTION: Bainds to the lipid a glycolipid present in the outer
membrane of all Gram-negative bacteria. The LBP/LPS complex seems
to interact with the CD14 receptor.
-!- SUBCELLULAR LOCATION: Secreted.
-!- SUBCELLULAR LOCATION: Secreted.
-!- SIMILARITY: Belongs to the BPI/LBP/Plunc superfamily. BPI/LBP Swann R.M., Sycamore N., Taylor R., Tee L., Thomas D.W., Thorpe A., Tracey A., Tromans A.C., Vaudin M., Wall M., Wallis J.M., Whitehead S.L., Whittaker P., Willey D.L., Williams L., Williams S.A. Proc. Natl. Acad. Sci. U.S.A. 99:16899-16903(2002).

-!- FUNCTION: Binds to the lipid a molety of bacterial lipopolysaccharides (LPS), a glycolipid present in the outer membrane of all Gram-negative bacteria. The LBP/LPS complex seems to interact with the CD14 receptor.

Immunol. 153:743-752(1994).

-!- FUNCTION: Binds to the lipid a moiety of bacterial lipopolypaccharides (LPS), a glycolipid present in the outer membrane of all Gram-negative bacteria. The LBP/LPS complex seems to interact with the CD14 receptor.

-!- SUBCELLULAR LOCATION: Secreted.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        13 PRWVSLMVLVAIGTAVTAAVNPGVVVRISQKGLDYASQQGTAALQKELKRIKIPDYSDSF

EXP. Med. 164:777-793 (1986).

-!- FUNCTION: Binds to the lipid a moiety of bacterial lipopolysaccharides (LPB), a glycolipid present in the outer membrane of all Gram-negative bacteria. The LBP/LPS complex st to interact with the CD14 receptor.
-!- SUBCELLULAR LOCATION: Secreted.
-!- SIMILARITY: Belongs to the BPI/LBP/Plunc superfamily. BPI/LBP
                                                                                                                                                                                                                                                                                                                                                                  Euteleostomi;

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

A;Title: Functional domains of recombinant bactericidal/permeability increasing protein A;Reference number: A49716; MUID:94124531; PMID:8294435

A;Molecule type: protein A;Residues: 32-130;132-141;143-165;202-215,'E',217-225 <LIT> C;Comment: The bactericidal/permeability-increasing protein (BPI) is a 60 kD membrane-as C;Comment: The bactericidal/permeability-increasing protein (BPI) is a 60 kD membrane-as which is specific for gram-negative bacteria. BPI has a high affinity for lipopolysaccha between BPI and an LPS-binding protein from liver and cholesteryl ester transfer protein

pING4512;

pING4512 encoded fusion protein.

```
The present invention relates to the isolation of human bactericidal/permeability-increasing (BPI) protein from polymorphonuclear latkocytes (PWN). BTI can be produced by growing in a culture medium, host cells transformed or transfected to express BPI encoded by chost cells transformed or transfected to express BPI encoded by cucleotides 124-1491 of the BPI polymucleotide sequence or its complementary strand. Despendent of the BPI polymucleotide sequence or its complementary strand. BPIs are useful against a wide range of Gramnegative bacteria particularly for the treatment of diseases caused by Cram-negative bacteria such as bacteraemia or sepsis, infections caused by Escherichia coli, Salmonella, Klebsiella or Pseudomonas, and skin infections which occur in bedridden patients suffering from decubitus infections which occur in bedridden patients suffering from decubitus closes) or in burn patients. They can also be used as a model for the design of new antibiotic agents, to provide sequence information on BPI to direct the design of future generations of antimicrobial agents pepcific for Cama-negative bacteria, and to be used as probes in molecular biological techniques. The presents the human BPI protein in protein therapy. The present sequence represents the human BPI protein
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              240

SASSES

RESULT 2 **AAR44420** 

This sequence is encoded by the plasmid pING4512. pING4512 was

constructed using the primer sequence given in AAG52480. Plasmid pINC4503

was cut with Alway. the ends made blunt with 74 DNA pOlymerase, and the
DNA then cut with Sall. The resultent approx. 700bp Sall/blunt fragment
Contains the 30 bp 5' untranslated region and the DNA encoding the signal
mains acids of bactericidal/permeability-increasing
protein (BPI). IgG heavy chain (HC) sequences, which also included the
hinge region of the IgG HC were PCR amplified from plasmid pMB27 using
these primers. Plasmids such as pING4512 may be used to produce fusion
conditions and their sequelae including endotoxin related shock and
conditions associated with it, such as disseminated intravascular
conditions anemia, thrombocytopenia, adult respiratory
distress syndrome, renal fallure, hypotension, fever and metabolic
acidosis. Proving BPI or a fragment of it, as part of the fusion with an
immunoglobulin heavy chain constant region provides the potential
cacharide complement binding and increasing placental transfer. (Updated
on 25-MAR-2003 to correct PN field.) This sequence represents the N-terminal of recombinant bactericidal/permeability (rBPI) protein. This expression product encoding the 31 residue signal protein and the first 199 amino acids of the N-terminal of mature human BPI has a molecular weight of 23 kD and is designated rBPI-33. In binding assays rBPI-23 was shown to have three separate functional domains with heparin-binding activity, at least three major domains with significant Limulus amcebocyte lysate (IAL) inhibition and one region with bactericidal activity. BPI, or active fragments of it may be used to treat and prevent the effects of chronic inflammatory disease states such as arthritis, psoriasis, inflammatory bowel disease, Crohn's disease and asthma. The sequence given is taken from Grey et al., and varies to that from Gazano-Santoro et al. In the latter, the valine at position 141 is specified by GTG rather than GTC and residue 185 is glutemaic acid (specified by GAG) rather than Iysine (specified by AAG). The expression vector also encodes for a 31 residue signal sequence. rBPI23 or biologically active derivs. are useful in the treating of a subject suffering from any of the physiological effects of LAM (lipoarabinomannan) from Mycobacteria. (Updated on 25-MAR-2003 to correct PN field.)

                                                                                              binding protein deriv. and hybrid protein binds to lipo:polysaccharide lacks CD14-mediated immuno:stimulatory properties, used to treat Gramnegative bacterial infections and associated conditions.
                                                                                                                                                                                              increasing protein (rBPI). The protein contains the lipopolysaccharide (LPS) binding domain fragments described in ARR68919-R68921. The fragments are used in the construction. of hybrid proteins for the treatment gram-negative bacterial infections and associated conditions. (Updated on 25-MAR-2003 to correct PN field.)

Recombinant endotoxin-binding protein comprising bactericidal/permeability increasing protein (BPIP) or its endotoxin N-terminal fragment, can be produced by growing genetically transformed host cells in a suitable medium so that BPIP is secreted into the medium. The BPIP is then isolated and can be used to control bacterial infections. (Updated on 25-MAR-2003 to correct PF field.)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Recovery of recombinant endotoxin binding protein - by culturing transformed cells in medium contg. cation exchange material, useful for treatment of bacterial infections.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 from the granules of mammalian polymorphonuclear neutrophils. The molwer of the entire human BPI protein is approx. 55,000 daltons. The Molwer of the entire human BPI protein, as well as the DNA encoding the protein, have been elucidated in Figure 1 of Gray et al., J. Biol. Chem. 264:9505 (1989) and are incorporated by reference. In Gazzano-Santoro et al., Infect. Immun. 60:473-4746 (1992) an expression vector was used as source of DNA encoding a recombinant expression vector was used as source of DNA encoding a recombinant expression product (IPBIZ3) having the 31- residue signal sequence and the first 199 AAs of the N-terminus of the mature human BPI, as set out in Figure 1 of Gray et al., except that Vall51 is specified by GTG ratether than GTC, and residue 185 is Glu (specified by GAG) rather than Lys (specified by AAG). Recombinant choprotein (IBPI) has also been produced having the sequence chocked for IBPIZ3 and the the exception that residue 417 is Ala (specified by GT) rather than Val (specified by GT). In the spec., the BPI protein product is used for the treatment of humans exposed to bacterial
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    KRIKIPDYSDSFKIKHLGKGHYSFYSMDIREFQLPSSQISMVPNVGLKFSISNANIKISG 120
